Pseudo content: url() — Block

The `::before` pseudo element on each chapter title below uses `content: url("icon.png")` with `display: block`. The icon renders above the heading via fulgur's pseudo-content image path.

Chapter 1

Body text follows the pseudo icon above. Because blitz assigns a zero-sized layout to text-less pseudo elements, the icon does not displace this paragraph — the `margin-top` on the h2 reserves the space manually.

Chapter 2

Another chapter demonstrating the same block-pseudo icon. Both chapters share the same stylesheet rule, so the icon appears above every chapter title automatically.

After pseudo

This section uses an `::after` pseudo for its icon instead, appended at the section's content-box bottom.

Inline Before

This paragraph has an inline `::before` pseudo with `content: url("icon.png")`. The icon appears at the start of the first line, inline with the text.

Inline After

This paragraph has an inline `::after` pseudo. The icon appears at the end of the last line.
